The New World of Surface Technology

AGTOS – Your new partner for all surface technology questions

View of **AGTOS'** head office in Emsdetten.

New sheet metal rack and laser.

AGTOS was founded by a special group of individuals who live and breathe surface technology.

Supported by a highly qualified staff of coworkers and colleagues, this group of experts is at the heart of your **AGTOS** team.

Our team has a great knowledge in the fields of development, engineering, production and distribution of shot-blast machines.

Our experience is backed by state-of-the-art production facilities at our own plant in Poland, an extensive warehouse facility at our headquarters in Emsdetten and an optimized business model.

In addition, a streamlined organizational structure and a high degree of team motivation make it possible to manufacture machines and blasting units with the same consistently high quality at an economical price. This is also true for all of the blasting services we offer.

AGTOS offers turbine-wheel shot blast equipment, including the appropriate transport system, for a wide range of applications. Examples include:

- Scale removal
- Rust removal
- Burr removal
- Paint stripping
- Roughening
- Cleaning
- Dressing
- Hardening

We place special emphasis on providing perfect customer service. This applies not only to the blasting equipment we manufacture, but also to many other makes of equipment. Our service program includes:

- Spare parts
- Modernization and performance enhancement
- Sale of used machinery
- Repair and maintenance
- Instruction and training

Together with our partner company, SLF Oberflächentechnik GmbH, we are able to realize overall solutions in the field of blasting and painting. SLF is specialized in the field of compressed air blast machines and painting systems.

We hope that we have stimulated your interest in building a close working relationship with **AGTOS**.

Additional information and news are available on request or through our web site at www.agtos.com.

Expanded production in our plant situated in Konin.

The **AGTOS** high-performance turbine – the heart of our blasting machines

More performance and better quality

We have developed the **AGTOS** high performance turbines in order to be able to offer reliable units that guarantee high efficiency with low spare parts costs. In comparison with usual turbines, the work pieces are blasted on

a larger surface and with constant quality. With available turbine wheel diameters ranging from 330 mm (Turbine 3.6) to 460 mm (Turbine 4.6) and correspondingly higher rpm rates, ejection velocities can be fine-tuned to achieve the blasting goal.

The easy replaceable wear parts of the turbine are available in different materials (p. ex. tool-steel and cast iron). Therefore, the units can optimally be adapted to each application.

Customers who operate an **AGTOS** blasting machine are not the only ones convinced by the **AGTOS** turbine. We also use the same turbine to optimize the blasting units of other manufacturers.

New, cleaner filter technology

Exchanging filter cartridges is now clean, quick and easy.

Easy and clean handling

Also here, our engineers have developed a unique concept in order to facilitate the operating sequences. **AGTOS** cartridge filter units are easy to maintain because the cartridges can be exchanged quickly and easily by means of a pullout carrier element. The cartridges have a conical shape and a coarse fold.

This promotes better adhesion and cleaning of dust. And only the paper or polyester cover requires disposal, not the entire cartridge. This saves money and helps protect the environment.

AGTOS blasting machines – latest technology with time-tested detail

Hanger-type blast machines are engineered as stand-alone solutions or designed for applications requiring continuous operation.

Hanger-type blast machines

Hanger-type blast machines are among the most flexible types of blasting equipment. They are also used to continuously blast a wide variety of work pieces.

AGTOS has already built many of these machines in a variety of sizes and types. For foundry applications, the machines can be equipped with additional solenoid air separators which reliably separate sand and abrasive.

Drum blast machines

AGTOS drum-type blasting units are ultra-modern machines based on a proven principle. They offer users many new technical details.

The drum is made of perforated manganese steel. There are no transition areas between moving and stationary parts. This prevents the jamming of work pieces.

Furthermore, the drum could easily and completely be discharged. That avoids a double treatment of each work piece.

Roller conveyor blast machine with crossover conveyor technology.

Roller conveyor blast machines

Roller conveyor blast machines are used to remove scale and rust from metal profiles and sheet metal components. By combining a roller conveyor with the appropriate crossover conveyors, individual process steps such as blasting, conservation, sawing and drilling can be interlinked. This ensures a flexible manufacturing process and high material output.

Another field of application for the roller conveyor blast machine is the blasting of large machine constructions as preparation for the subsequent conservation process.

Vertical roller conveyor blast machine.

Diabolo blast machines

Diabolo blast machines are used to remove scale and rust from pipes, rods and rounded objects. If desired, blow-off equipment can be used to free pipes of abrasive.

Special transport technology provides for optimal integration of these machines in the manufacturing process. This increases flexibility and ensures high material throughput.

Steel mill tumble blast machine with forgings

Rubber- and steel belt tumblast machines

The tumble blast machine's endless rubber mill continuously turns the work pieces and exposes them to the abrasive stream for the entire blasting time. The use of a rubber mill ensures a relatively gentle tumbling motion. Because clearances in the mill are kept small, it is also possible to blast extremely tiny work pieces.

The machine can be filled and emptied in automatic mode using a loader and take-off conveyor. This is performed manually or with the help of lifting equipment in semi-automatic mode. Direct unloading into a variety of containers or onto a conveyor belt is also possible.

Rotary table blast machines

Rotary table blast machines are usually loaded manually. They are most frequently used to clean cast or die-cast work pieces in batch mode and to roughen the surfaces of work pieces before coating.

In automated lines, primarily in the automotive industries, satellite rotary table blasting machines often include integrated robotic handling devices. An example would be the surface hardening of transmission components.

Rotary table blast machine.

Automated satellite turntable blast machine for castings.

Service for blasting machinery

Retrofitting of blasting machines with magnetic air classifiers for the separation of abrasive and sand.

Used machines are technically overhauled and then integrated into plant operations. Working on its own or as a general contractor, **AGTOS** undertakes disassembly, transport and re-assembly of the machines.

We place special emphasis on providing perfect customer service. This applies not only to the blasting equipment we manufacture, but also to other makes of equipment. Our service program includes:

- Spare parts
- Modernization and performance enhancement
- Repair and maintenance
- Instruction and training

Configuration of steel mill tumble blast machines with new wear-parts.

A wide range of abrasive types can be delivered on short notice.

Workpiece trestle for hanger-type blast machines.

Turbine parts for many turbine brands

In addition to replacement turbine parts, we also supply filter cartridges, cleaning and sealing brushes, and pre-cut rubber and manganese blanks for many machine types.

Bucket elevator belts, buckets and screws for all makes of blast machinery.

In addition to the representatives listed below, **AGTOS** works closely with other regional partners.

1 Headquarters:

AGTOS
Gesellschaft für technische
Oberflächensysteme mbH
Gutenbergstraße 14
D-48282 Emsdetten
